PROJECT SUMMARY

We propose the creation of advanced capabilities for data acquisition, communication, processing, querying, presentation, management, and curation that can comprehensively serve the needs for multidisciplinary research and education pertaining to the environment, water, and energy in Nevada. The envisioned new centerpiece of the currently under development SENSOR system, the Nevada Center for the Environment, Water, and Energy, will incorporate large volumes of data and information, and will provide a broad range of software tools and services that will cater to the needs of many stakeholders statewide and nationwide. This will be a substantial extension of the existing Nevada SENSOR cyber-infrastructure (CI) and its key "front-end" component, the Nevada Climate Change Portal,

The overarching theme for the proposed work is "Evolving Nevada's cyberinfrastructure to support research and education on topics that interconnect the environment, water, and energy." In pursuing this theme, we rely on interdisciplinary ties established and the infrastructure, technical knowledge, and scientific expertise acquired during the ongoing NSF EPSCoR RII program, which made possible the creation of the SENSOR system and its Nevada Climate Change Portal. Further, we have assembled a diverse and complementary team of researchers, educators, and technical staff capable of building upon the work done so far and advancing its scope to address new scientific questions in a new interdisciplinary setting, this time also encompassing (in addition to water and the environment) the important domain of energy, with emphasis on renewable energy.

The project team is organized in four groups (or thrusts): CI, Water and Environment, Energy, and Education and Outreach, and it is composed in equal parts of participants involved in the current NSF EPSCoR RII award, who will ensure knowledge transfer and smooth project transition, and new collaborators, who will pursue new directions of research and development. The main science questions that we will catalyze the project are:

- (1) What are the spatial and temporal responses of linked hydrologic, ecologic and human systems to climate and land use change?
- (2) How does this response affect long-term availability and management of water for natural systems and water and energy for human use?
- (3) How do temporal and spatial coordinates and atmospheric conditions affect the energy usage and production from renewable energy?

To support scientific research efforts on answering these questions, the CI component will focus on: (i) Computational hardware extension; (ii) Monitoring network expansion; (iii) Incorporation of broader environmental, energy, and hydrological research data; (iv) Development and optimization of data management software; (v) Creation of new software tools in support of research and education, in particular for new interactive simulations, intelligent data mining and analysis, and new visualizations that facilitate education; and (vi) Development of dynamic models that utilize SENSOR data systems.

The CI component will also facilitate the integration of research results in Education and Outreach by providing support for this group's planned formal, non-formal, and informal educational and outreach activities.

Intellectual Merit: The proposed multidisciplinary work distinguishes itself through its emphasis on high-quality, verifiable, multidisciplinary CI-enabled research (stemming from high-performance computing resources and high-quality data management processes involved) at the unique confluence of three fields especially important for Nevada: the environment, water, and energy. This integrative effort will charter unfamiliar territories of collaborative work and will provide a model for others to follow. The scientific explorations involved in the project will lead to an increased understanding of the complex, dynamic interplay of water, environment, and energy variables, as well as of the intricate effects of human and climate induced changes on water resources, energy availability, and environmental consequences, for example on the interaction among urban structure, urban energy entrapment, and water demand. The modeling and simulations performed will build specialized multidisciplinary expertise within Nevada, which will bring our project's participants to the forefront of national and international research, and will generate new hypotheses, thus guiding future investigations.

FROM CLIMATE CHANGE PORTAL TO NEVADA DATA CENTER FOR RESEARCH AND EDUCATION ON THE ENVIRONMENT, WATER, AND ENERGY

1 STATUS AND OVERVIEW

Funding received as a part of the ongoing NSF EPSCoR RII award [1] has facilitated the creation of a reusable cyberinfrastructure (CI) for high-quality scientific research: the Spatial Engine for Nevada Scientific Observational Results (SENSOR) system [2][3]. The front end for this system is the Nevada Climate Change Portal (NCCP) (Figure 1), which enables access to SENSOR resources to a broad range of stakeholders, from researchers and educators, to students, policy makers, and the general public. This system facilitates the collection, aggregation, storage, and processing of raw data from various sources (i.e., remote sensors) and provides robust access by interested parties to this data and information generated from it. While the initial infrastructure-building efforts [4] centered on the incorporation of climate research data from transects and the retrieval of data for interested researchers and public entities, the system has been designed for extensibility, allowing it to easily incorporate virtually any data source into its unified, extensible data architecture. As detailed later, this *architectural extensibility* is of paramount importance for the work envisioned in the present project proposal.

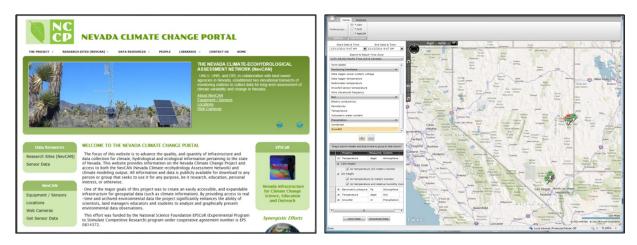

Fig.1 The Nevada Climate Change Portal, the Front End of the SENSOR System: Home Page on the left, Sensor Data Selection Page on the right

The SENSOR system, whose high level data-focused activities are shown in Figure 2, is revolutionary in comparison to existing research data systems, extending the role of CI and data management activities from the initial point of data acquisition (i.e., data loggers or data aggregators) to the data repository itself (i.e., the portal's file system and database [5]). This architectural difference allows the SENSOR system to provide many features that are critical to long-term multidisciplinary research needs, including: time synchronization and data correlation, error-free data collection and storage, asset management, data curation, unit conversions, metadata exchange and generation, complete data verification and tracing, centralized quality assurance (QA) and quality control (QC) data assessments, robust data selection and search features, multiple data formats, and multiple data access mechanisms (i.e. web pages, web services, and files). The implemented system frees researchers from all intermediate data activities, allowing them to focus on designing the data collection system and using the collected data.

In contrast to other scientific research data systems, SENSOR collects and provides *verifiable*, *traceable data* to interested entities. Acknowledging the fact that environmental sciences are fields that involve a great deal of non-repeatable data collection for trend analysis, SENSOR has been designed and implemented to eliminate the introduction of errors from the data collection process. In large part, this is

Fig.2 From Climate Change Data to Information in the SENSOR System

achieved by utilizing monitoring hardware and network infrastructure components that transmit data without loss (specifically, using TCP/IP networking), as opposed to the error-inducing transmission mechanisms that are commonly used in monitoring deployments for communication (e.g., one-way satellite communication/GOES). The use of specialized software to automate the acquisition and management of this data further eliminates the potential for error by removing the possibility of common researcher-introduced errors such as data modification, data filtering, data loss due to misplacing of data files, and manual conversion errors. Further, SENSOR defines a set of *data and infrastructure maintenance policies* that require all changes to infrastructure and all corrections applied to data be completely documented by the involved personnel; these policies are reinforced by SENSOR software that detects such changes and requires appropriate documentation. This unique combination of hardware, software, and policies provide a high degree of verifiability to all data collected in the system, allowing researchers and other stakeholders to closely examine data and corroborate its accuracy.

The SENSOR system largely automates and simplifies the management of *metadata* [6][7]related to the data collected by the system. To achieve this, SENSOR incorporates an *asset management system* that records all relevant information related to the collection of data, including: sensor and infrastructure hardware deployed and maintenance records, infrastructure configuration parameters and changes, and geospatial locations. Combined with the additional project information present in the system, SENSOR contains a full complement of metadata that can be used for data curation, verification, management, synchronization, and exchange activities. By embedding this information within the system itself, the need for researcher or maintenance personnel interrogation related to data and system parameters is minimized, yet accurately and centrally captured.

As shown in Figure 3, which depicts the research, education and outreach activities facilitated by the SENSOR system and its NCCP centerpiece, the primary interface to this system is the NCCP web portal, which hosts, among other things, information regarding the SENSOR system itself, the projects that utilize its services, and search interfaces to the data. The portal hosts access to the collected data via web-based *search interfaces* that facilitate navigation and selection of sensor data in various ways, as well as to *web services* (i.e., SOAP and REST) that provide efficient software-based access to the data for advanced computational systems (e.g. climate modeling, trend analysis, current site conditions, etc.). In addition, the portal provides a number of interfaces and displays to aide in the maintenance of equipment and infrastructure by project personnel, simplifying maintenance operations and diagnostics while documenting the metadata necessary to ensure long-term data viability, validity, and verifiability.

At the present, the SENSOR system is the primary repository for collected climate data and information from the previous NSF EPSCoR RII ("Track I") award, providing researchers with the long-term data they require for their analyses via generalized cross-discipline interfaces. Vegetation and meteorological data collected by Campbell Scientific data loggers [8] have been automatically imported into the SENSOR database and made available to all interested parties. Live camera streams from all deployed sites are available for public viewing on the web portal, while periodic web camera images are being captured and stored for maintenance and later analysis. Additionally, SENSOR is successfully participating in data and metadata exchange with NSF EPSCoR ("Track II") [9] partners in Idaho and New Mexico. These efforts will add redundancy to the data collected by SENSOR while at the same time increasing the availability of the data by exposing it on these external data repositories.

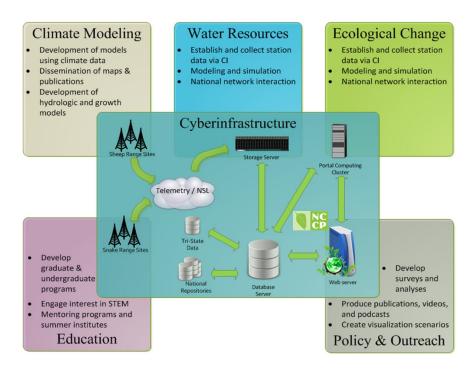

Fig.3 Research, Education, and Outreach Facilitated by the SENSOR System and its NCCP Centerpiece

The NCCP, while still under development, is establishing itself as the CI hub for the research, education, and outreach activities envisioned in the ongoing NSF EPSCoR RII Track I project. In addition to the capabilities previously described, the NCCP provides functions and features that benefit all six current project components, from Climate Modeling, Water Resources, and Ecological Change, to Education, Policy, Decision Making & Outreach, and CI itself. The portal serves (or will serve) for the dissemination of various types of project results, including model outputs, maps, publications, videos, course materials, and educational games, and will provide access to a growing set of new software tools.

An example of such software tool is the *Demeter* [10][11] software framework for data processing and model interconnection. Specifically, Demeter aims to couple various data models with appropriate user-defined data sources, addressing a disconnect that has hindered the efficient use of collected data sets by the scientists. Via its *Persephone* interface, Demeter allows users to graphically interconnect data sources, transformations, and models to create scenarios that bring together disparate resources in a way that reduces the time and effort required to execute simulations.

The SENSOR system will continue to be enhanced through the end of the current Track I funding. During this time, additional interfaces will be added to streamline infrastructure management and system configuration; data from external sources will be linked or integrated to consolidate and enhance information for researchers; project libraries will be extended to include additional publications and videos, simplified public interfaces that use live data will be incorporated; further development and coordination of controlled vocabularies will take place; new software tools will be developed; the data systems will be performance tuned and optimized; and additional QA and QC processes will be integrated, amongst other developments. SENSOR will also undergo improvements such as the implementation of OGC web services [12] [13] [14], and the increased exchange of data and metadata with Idaho and New Mexico as "Track II" developments. The end result will be a system that is well-poised for extension and reuse by new research projects, having a plethora of features and infrastructure readily available for consumption and further development. This is exactly where the work proposed here fits in, as a natural and essentially mandatory extension of a system that has involved the concerted effort of many researchers and developers and has been explicitly designed for growth.

2 RESULTS FROM PRIOR NSF AND OTHER FEDERAL SUPPORT

The inclusion of facilities, personnel, and infrastructure developed by the ongoing NSF EPSCoR RII (Track I) efforts, part of the "Nevada Infrastructure for Climate Change Science, Education, and Outreach" (2008-2013) [1], brings a significant number of relevant prior resources and results into the newly proposed project. In this current Track I project, 12 team members of the present proposal have been involved, while the other 12 are new collaborators on the proposed work. Faculty and technical staff involved in the current Track I Nevada-wide project are: Nick Lancaster (project co-PI and DRI organization PI), Scott Mensing (project co-PI and UNR organization PI), Sergiu Dascalu (leader of the CI component), Lynn Fenstermaker (leader of the Water Resources component), Franco Biondi (leader of the Ecological Change component), Jay Arnone (member, Ecological Change), Haroon Stephen (member, Water Resources), Fred Harris, Shahram Latifi, Mike McMahon, Eric Fritzinger (members, CI group), and Scotty Strachan (member, Ecological Change). This ongoing project has also supported about 3 Graduate Research Assistants (GRAs) per each project component, for instance in the CI component two PhD students and 1 Master student have been funded.

Chief amongst the results obtained in this project are the cyberinfrastructure developed as a part of the SENSOR system, which spans hardware and software systems. The hardware that constitutes the SENSOR system includes 31 computing cluster nodes, 3 24TB storage servers, 2 virtualization servers, multi-gigabit networking infrastructure, UPS systems, and a distributed data collection network spanning 12 remote data sites and incorporating hundreds of sensors. Resulting (newly designed and developed) software systems include the Nevada Climate Change Portal, various SENSOR-related software tools, applications, and data structures for data collection, management, and curation, 8 virtualized infrastructure servers, the Demeter software framework for data and model interconnectivity, a cutting-edge geospatial database and related schema, and visualizations that facilitate data search and retrieval. Together with the expertise of the personnel (i.e. professionals, post-doctoral members, and students) that architected, designed, and implemented them, these software and hardware systems form the initial cyberinfrastructure that will be significantly enhanced by the proposed research and new cyberinfrastructure-building activities.

Notably, the CI component's efforts have also resulted in several published articles, three on SENSOR and NCCP [2] [3] [4], and two the software framework for model and data interconnectivity [10] [11].

The ongoing NSF EPSCoR RII Track I efforts have also generated a number of results in terms of the scientific research (i.e. hydrological, ecological, environmental, and atmospheric). Researchers developed probability models of time-series episodes in terms of their duration (the number of time intervals continuously above or below a reference level), magnitude (the sum of all series values for a given duration), and peak (the absolute maximum value for a given duration). Applying these models to a new bivariate model for episode duration and maximum to a 2,300-year moisture-sensitive tree-ring chronology [15] resulted in significant progress toward the development of a trivariate model linking episode duration, magnitude, and peak [16] [17] [18] [19] [20] [21] [22] [23]. Other mathematical developments generated by the project included deriving the theoretical distribution of the ratio between maximum and magnitude for an episode [24].

Paleoclimatic methods were further improved by developing a watershed model for reconstructing streamflow from long proxy records [25], by quantifying variability in paleorecords using a new procedure based on the Gini coefficient [26], and by proposing a theory-driven method for computing tree-ring chronologies [27]. Public-domain software was generated from the project, either as a standalone tool [28] or as a component of a larger package [29]. The establishment of baseline biotic data sets –facilitated by project cyberinfrastructure— have produced a reference point for long-term environmental research on various fronts. Three graduate and five undergraduate students received training, and one graduate student used this project for his thesis research. This body of resulting scientific work provides guidance in identifying the research questions for this proposal, as well as a point of continuation for long-term studies and scientific developments.

A notable collaboration opportunity that stemmed from the ongoing NSF EPScoR RII (Track I) program was the NSF EPSCoR-funded project "Cyberinfrastructure Developments for the Western Consortium of Idaho, Nevada, and New Mexico" [9]. In this project, Dascalu and Harris and their Nevada CI group consisting of a postdoctoral research associate and a graduate research assistant have had the opportunity to collaborate with similar groups from Idaho (Idaho State University and University of Idaho) and New Mexico (University of New Mexico, Albuquerque). The project has extended network connectivity among the three states as well as data and metadata exchange among the Consortium states' main data repositories. Joint work on new software tools and collaborative modeling and simulation scenarios has also taken place.

In addition to prior work in the above mentioned projects [1] and [9], the inclusion of other project members further incorporates a broad base of previously-developed resources. Expertise in the fields of outreach and education includes significant experience with multi-million dollar grant funding involving various agencies, such as: the Nevada State Gaining Early Awareness and Readiness for Undergraduate Programs (GEAR UP) (USDoE); USDoE School to Work; USDA Cooperative Extension programs for Children, Youth and Families, Natural Resources, Nutrition, Diet and Health, Agriculture Profitability and Sustainability, and Community Development and Sustainability; and multiple USDA Smith Lever 3(d) supported programs. The results of these management and interaction activities will help ensure that the maximum outreach exposure and educational integration are obtained by the project and its participants.

Prior field-specific developments will also play a critical role in the proposed energy-related research, particularly some of the prior efforts of Dr. Trzynadlowski [30]. For the project "Communication Enhancement in Power Electronic Systems by Spectral Nulls" (09/01/2006 to 08/31/2009), the goal was to evaluate the feasibility of spectral shaping of output voltage in PWM power electronic converters. The spectral shaping is focused on elimination of specified frequency components from the electromagnetic noise by creating the so-called spectral nulls, which can then serve as communication channels in the noise. Computer simulations and laboratory experiments have confirmed the proposed theory.

For the project "Collaborative Research: High-Efficiency New Gearless Power Conversion Systems with Silent Permanent Magnet-Machines" (09/01/2008 to 08/31/2011), the aim of the collaborative effort with Louisiana State University (LSU) was to investigate novel permanent-magnet AC machines characterized by low speed and noise, and high efficiency. Two prototypes, both with an outer rotor and high number of magnetic poles, resulted: (1) multi-layer winding synchronous machine (at LSU), and (2) switched-flux machine (at UNR). They can be utilized as in-rim motors for gearless electric cars, carts, and automated wheelchairs, or as generators for low-power wind turbines.

For the project "Collaborative Research: Investigation of Fundamental Aerodynamic and Power Electronic Issues of Rooftop Wind Panels" (09/15/2009 to 08/31/2012), the aim of the collaborative effort with California State University Long Beach (CSULB) was to investigate a novel concept of rooftop wind panels. The panels, composed of horizontal wind rotors, are expected to gain a higher degree of public acceptance than the traditional blade turbines. Numerous computer simulations have been performed and a novel power electronic generator-grid interface has been designed.

The inclusion of the resulting systems, knowledge, and expertise of the personnel involved will strongly guide the direction and shape the design and implementation of energy monitoring and profiling systems. Further, the detailed knowledge of renewable power generation systems will be critical in properly leveraging the ample renewable resources present in Nevada, providing optimal energy conservation determinations and integration of renewable power systems.

3 RESEARCH PROGRAM

3.1 VISION AND GOALS

Building on the infrastructure, technical knowledge, and scientific expertise acquired in the current cycle of the NSF EPSCoR RII program, our vision is to take advantage of the interdisciplinary ties created and the CI developments made in this program and advance them to a higher level of research and education-supporting capabilities, from which an extended community of stakeholders could benefit. Specifically, these stakeholders will include scientists, educators, students, policy makers, and the general public.

The focus on this proposal is largely on CI advancements, yet these are driven by a number of important research questions. The overarching theme for this pre-proposal is "Evolving Nevada CI to support research and education on topics that interconnect the environment, water, and energy" and to pursue it we have assembled a project team with four components (or thrusts): Cyberinfrastructure, Water and Environment, Energy, and Education and Outreach.

Numerically, half of the proposed project's participants (12 in total) have been involved in the current NSF EPSCoR RII award, thus ensuring knowledge transfer and continued progress, while half are new collaborators, thus enabling new avenues of exploration and development. Important additions to the collaborating team are those of the energy experts from UNR and UNLV and, respectively, the formal involvement of specialists from the Nevada Seismological Laboratory (NSL).

The main research questions, stemming from the science groups, are as follows:

- (1) What are the spatial and temporal responses of linked hydrologic, ecologic and human systems to climate and land use change?
- (2) How does this response affect long-term availability and management of water for natural systems and water and energy for human use?
- (3) How do temporal and spatial coordinates and atmospheric conditions affect the energy usage and production from renewable energy?

Regarding CI, the goal is to build upon the existing SENSOR system and the component that epitomizes it, the NCCP, and enhance the existing CI with advanced data management, communications, and computational capabilities that can serve more comprehensively the needs for multidisciplinary research and education in Nevada. The envisioned extended SENSOR system (Figure 4) is best represented by its new "front end," the Nevada Data Center for the Environment, Water, and Energy.

Substantial advancement and transformation of the NCCP into the Nevada Center for the Environment, Water and Energy will be achieved through the following: (i) Computational hardware expansion; (ii) Monitoring network expansion; (iii) Incorporation of broader environmental, energy, and hydrological research data; (iv) Development and optimization of data management software; (v) Creation of new software tools in support of research and education, in particular for new interactive simulations (including what-if scenarios), intelligent data mining and analysis, and new visualizations that facilitate education; and (vi) Development of dynamic models that utilize SENSOR data systems.

The CI component will also facilitate the use of research results in Education and Outreach by providing development support for this group's implementation of their planned formal, non-formal, and informal education activities.

While at core the above planned extensions and enhancements are focused on strengthening CI capabilities in Nevada, the implications of the proposed project are immediate and compelling, particularly in terms of: facilitating advanced research in environmental sciences and energy; supporting multidisciplinary scientific exploration for improved understanding of the interdependencies of energy, water, and the environment; providing powerful, new-generation computing capabilities for education and outreach; diversifying and expanding the involvement of stakeholders in using the CI currently being built in Nevada; and strengthening recently formed partnerships with scientists and engineers from other states (i.e., with Idaho [31] [32] and New Mexico [33]) and extending them to include organizations from additional states and, possibly, other countries. The new, advanced CI for Nevada will serve as hub for

interdisciplinary work and will bring Nevada to the forefront of scientific research and development in the Nation.

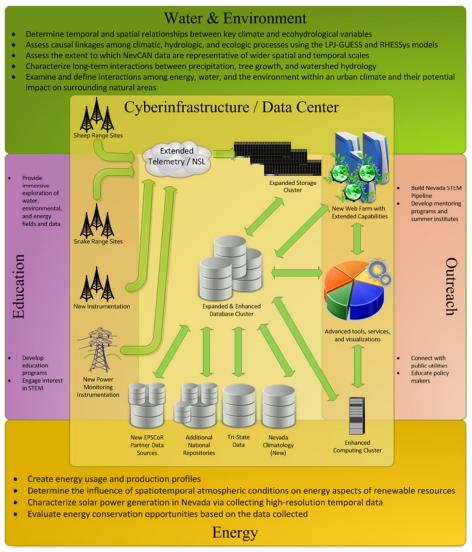

Fig.4 The Extended SENSOR System and its Hub, the Nevada Data Center for the Environment, Water, and Energy

3.2 BACKGROUND

One of the most basic requirements for almost every scientific research project is *the need to collect and manage the data* for that project; fields such as environmental research that rely on trend analysis depend almost exclusively on data collection. Often overlooked are the management and availability of the data over both the long- and short-term. Good research practices as well as changes to the requirements of funding agencies [34] require that these two broad problems be explicitly and satisfactorily resolved. Addressing these issues quickly exposes a host of other problems relating to data quality, verifiability, collection methods, documentation, and long-term usability of project data, to name a few.

Other entities around the world have attempted to address the need to create data repositories that collect, manage, and curate high-quality research data. Efforts focusing on centralization are rather common, resulting in the creation of data centers such as the New Mexico Resource Geographic Information System (RGIS) [33], the Northern Knowledge Network (NKN) [32], and the Western Regional Climate Center (WRCC) [35] that are very capable of aggregating data, but lacking in their

ability to retain or document data quality. At the other end of the spectrum are efforts such as the Digital Curation Center (DCC) [36] and the Joint Information Systems Committee Advanced Climate Research Infrastructure for Data (JISC ACRID or ACRID) [37] that provide only advice and expertise in managing / curating research data; the implementation of appropriate infrastructure and practices is left for the researchers. The novel and highly-elusive solution is the fusion of these two extremes: the unification of data management practices into the research process, ultimately resulting in the creation of a *data center* that incorporates lossless data acquisition infrastructure, centralized data storage, and advanced data curation and management practices. Such a center for CI would exist independently of any one research project, but would be extensible and reusable by any future research activity that generates data.

The SENSOR system was created as a part of NSF Nevada EPSCoR Track I efforts to provide highquality data collection, management, access facilities for involved researchers and the public. Unlike other project-centric efforts, SENSOR was designed to address the immediate needs of the project, but also architected to be extensible and flexible enough to be reused and adapted to any future research. A unique region with a semi-arid, high desert environment, Nevada hosts a wide variety of research opportunities for scientists in climate research, hydrology, renewable energy, atmospheric sciences, ecology, and other fields. The extensible, cross-disciplinary nature of SENSOR is extremely conducive to the broad variety of research opportunities available in Nevada. As such, the proposed expansion of the SENSOR system from a project-level collection of CI to an independent, reusable "CI center" – a data center that incorporates reusable physical infrastructure, software, and policies to facilitate the lossless collection, management, and dissemination of high-quality research data – would streamline, optimize, and revolutionize research within Nevada, providing a concrete model of implementation for other regions around the world. The ample opportunities to integrate disparate cross-disciplinary data sources would simultaneously expand the capabilities of the SENSOR system (driving innovations for each incorporated discipline), reduce the repetitive hardware costs associated with research data activities, and empower researchers with data verifiability and quality –as well as advanced research opportunities and guidance—that were previously unavailable.

The growth of the SENSOR system in this manner will be challenging. The creation of this "CI center" will require the management, implementation, and development of a new combination of networks, data systems, software systems, maintenance policies, neutral data standards, server infrastructure, and access mechanisms to achieve the quality and management required by researchers. Further complicating development will be the diversity of data sources involved in each discipline and project, as well as the specialized data access and visualization needs of each of those fields; balancing the long-term need to retain flexibility through data neutrality and the highly specialized needs of researchers and disciplines will be a complicated and delicate –yet achievable– process.

3.3. RESEARCH AND DEVELOPMENT THRUSTS

3.3.1 CYBERINFRASTRUCTURE THRUST

[Dascalu, Harris, Louis, Varol, Latifi, Kent, Smith, Bryant, Gunes, McMahon, Fritzinger]

Objectives

Nevada's ability to compete for research funding at state, regional, and national levels depends upon the construction of a quality reusable cyberinfrastructure for multi-disciplinary research. Developed as a part of the current NSF EPSCoR RII program, the SENSOR system was architected and implemented to first serve the needs of climate researchers. Encompassing cutting-edge computing hardware, software, network, and research devices, SENSOR is ready to incorporate the needs of additional research fields, providing them with the expertise and infrastructure they require to perform high-quality, verifiable, accessible research that conforms to the highest scientific standards.

The main objective of the CI project component is to build upon the existing SENSOR system and enhance the existing infrastructure with advanced communication, computing, data acquisition, data processing, and data management capabilities that can serve more comprehensively the needs for

multidisciplinary work in Nevada on topics placed at the union and the intersection of our research thrusts on water, environment, and energy. The Nevada Data Center for the Environment, Water and Energy will incorporate large volumes of data and information as well as provide a broad range of software tools and services that will cater to the needs of numerous stakeholders in the state of Nevada and nationwide.

Proposed Work

Toward these ends, the CI component proposes the following activities:

- Computational hardware expansion: To accommodate the storage requirements of existing, proposed, and future research efforts, additional high-speed storage, computing, and related infrastructure hardware would be added to the SENSOR infrastructure. This additional hardware would facilitate the optimization of data access, improved redundancy, enhanced data curation and management activities, server virtualization upgrades, and improved database operations.
- *Monitoring network expansion:* Leveraging existing relationships with the NSL [38] and other entities, the communication network utilized by SENSOR would be expanded to include additional urban and sub-urban locations as determined by the scientific components. These expansions would continue to utilize high-speed, lossless communication mechanisms (e.g. TCP/IP radios, Ethernet networks, etc.) to enable cutting-edge, high-precision research.
- Incorporation of broader environmental, energy, and hydrological research data: This entails the inclusion of data sources (i.e., loggers, satellite imagery, and other repositories) utilized in these disciplines, beyond those already present in SENSOR. This development involves the incorporation of new sensors, import processes, metadata tracking, asset management, and appropriate visualizations using a combination of software, hardware, and network resources.
- Data management software development and optimization: Expanding upon the developments of the SENSOR system, the database schema and operations will be expanded and further optimized for the newly-incorporated research fields. Additionally, software systems will be developed and/or expanded to support additional data source import needs, curation activities, QA and QC assessments, format requirements, search features, and research activities.
- Creation of new software tools for scientific research and education: New software tools and applications will be researched and developed and/or integrated in the Data Center, in particular for interactive simulations, running what-if scenarios in user-friendly environments, intelligent data mining and analysis, and educational and outreach purposes. Also developed will be webaccessible data visualizations that correlate and represent data from multiple disciplines to facilitate education efforts and the efficient selection of appropriate data for detailed research analysis. Applications for portable devices such as iPhones and iPads will also be considered for design and development.
- Development of dynamic models that utilize SENSOR data systems: To aid researchers using software systems to analyze and manipulate data, additional web services will be created (potentially in-tandem and consultation with the new software systems involved in the project) to make the data efficiently accessible and consumable by those systems. Developing data services oriented specifically toward data modeling needs are critical for future modeling research.

Integrative Aspects

As a component whose role is the facilitation of nearly all activities in the scope of this project, the CI group will communicate with all components throughout the duration of the project. For the research thrusts, CI will guide hardware selection and management efforts to ensure data quality and accuracy, facilitating data acquisition and delivery to the researchers. For education components, CI will support access to collected research data, information related to the research (e.g. visualizations, videos, etc.), and communication between researchers and the education (student and teacher) community – likely through a project-specific website integrated within the existing portal. For policy makers, CI will facilitate the transparent dissemination of data and information upon which policy decisions are based from researchers

to the public and government officials. In short, CI will serve as the short- and long-term collection of computer expertise and technology that integrates all the project's components and stakeholders.

3.3.2 WATER AND ENVIRONMENT THRUST

[Fenstermaker, Lancaster, Arnone, S. Mensing, Biondi, Stephen, Tang, Strachan]

The Great Basin, which includes most of Nevada, is considered one of the most endangered environments in the U.S. as a result of numerous interacting factors including climate change, urbanization, changing land use, limited water resources, altered fire regimes, invasive species, insect outbreaks, and plant disease [39]. The close linkages that exist between stressors and their importance for land management and public policy highlight the need for an integrated approach in which biophysical and human responses are studied by interdisciplinary research groups. It is also vital that anthropogenic influences on the environment, particularly water resources, can be distinguished from responses to climate change. This requires access to large datasets, sophisticated modeling and data analysis tools, and experience interpreting the results of these efforts, which will be provided by the proposed infrastructure building effort.

For example, recent analyses relating temperature and precipitation records to stream flows (e.g., [40]) indicate strong relationships of seasonal and interannual climate variability with surface water flow. These relationships may reflect plant ecophysiological responses to climate or responses to purely physical hydrologic processes. One example is the unprecedented growth peaks during the last few decades of bristlecone pines (*Pinus longaeva*) growing near the upper tree line limit [41]. While this trend is matched by increased air temperature in PRISM data, there are no in-situ observations of environmental drivers that allow for a clear, physiological explanation of the diverse bristlecone growth patterns observed at different elevations. Other analyses describe recent and projected declines in the fraction of precipitation that falls as snow at upper elevations and decreases in rainfall amount as a result of atmospheric greenhouse gas radiative warming of the troposphere if the mean winter wet-day minimum temperatures increase above -5°C. Taken together, these responses may lead to earlier snowmelt, runoff, plus streamflow and seasonal flooding.

Major Science Questions and Proposed Work

The water and environment thrust will expand data archives and initiate research and modeling efforts to address two overarching science questions for the Great Basin environment: (1) What are the spatial and temporal responses of linked hydrologic, ecologic and human systems to climate and land use change? (2) How does this response affect long-term availability and management of water for natural systems and water and energy for human use?

These questions will take time, resources and decades of data to fully evaluate. We will combine the following four approaches to begin to address the questions: (1) acquisition, integration and scaling of spatially referenced data sets; (2) assessment of future and past climate and hydrologic model uncertainty; (3) linkage of hydrologic and ecosystem models; and (4) assessment of human activities on energy, water and environmental systems. We will use existing data sets compiled by the research team and others and we will collect critical new data sets to fill data gaps. We also will leverage existing physical infrastructure, constructed through a NSF EPSCoR award, which includes monitoring stations located along two elevational transects in the Snake and Sheep Ranges; the Nevada Climate-ecohydrological Assessment Network (NevCAN). These stations will provide atmospheric and hydrologic data within five vegetative zones, from basin-dwelling phreatophytes to high-elevation sub-alpine communities.

Objectives

- 1. Determine temporal and spatial relationships between key climate and ecohydrological variables, specifically between temperature, net radiation and precipitation with changes in soil moisture, basin recharge, ET and plant productivity.
- 2. Assess causal linkages among climatic, hydrologic, and ecologic processes using the LPJ-GUESS and RHESSys models.

- 3. Assess the extent to which NevCAN data are representative of wider spatial and temporal scales.
- 4. Characterize interactions between precipitation (timing, quantity, and phase) and tree growth, and determine their influence on watershed hydrology over long time scales using dendrochronological records as inputs to simulation models.
- 5. Examine and define interactions among energy, water and environment within an urban climate and their potential impact on surrounding natural areas.

General Methodology

In addition to statistical analyses of temporal and spatial relationships between variables measured by individual project personnel, LPJ-GUESS, RHESSys and other models will be used to integrate and interpret the relationships among variables to assess causal linkages among climatic, hydrologic, and ecologic processes. Assembling and archiving all the data sets required to run these models will be a valuable exercise in the verification and assimilation of multiple datasets from NevCAN and other sources and will result in an extensive database that will be made available to the public via SENSOR and the Nevada Climate Change data portal. The modeling exercises will build expertise within Nevada and will also serve to generate new hypotheses and identify data gaps, and thus guide future investigations.

The data from NevCAN represent two elevational transects at two different latitudes. Use of these data for regional studies of ecohydrologic responses to climate change (including climate and hydrologic modeling), as well as management of land and water resources, requires that the project assess the extent to which NevCAN data are representative of a wider spatial and temporal framework and develop methods to extrapolate NevCAN observations to larger temporal and spatial scales. This will be achieved in several ways, including: (1) linking NevCAN observations to satellite image data; (2) determining microclimate variability around selected NevCAN sites; (3) developing relationships between measured climate and ecohydrological variables and those simulated by models, including PRISM; (4) relating dendroclimatology at NevCAN sites to longer term records.

Urban areas, being a hybridization of natural and human systems, represent a complex and dynamic interaction among energy, water, and environment. With the rapid growth of urban areas, it is imperative to gain a better understanding of these interactions. Many urban water-energy-environment models have been developed in the past [42][43][44][45][46]. A major constraint in such studies is insufficient data for calibration and validation. We will develop sensor network infrastructure and research to better understand the relationship between urban structure, energy entrapment (urban heat island effect), and water demand. The proposed work will include three aspects: 1) deploying low cost urban sensor network to measure vital urban variables (solar insolation, temperature, precipitation, evaporation, etc.); 2) integrating the sensor network and ancillary data into the existing cyber infrastructure; and 3) creating partnerships with the urban planning agencies to incorporate the infrastructure and science into future urban planning. The proposed work will provide sensing network for measuring urban climate and answer key questions about urban water and energy balance and connections to urban environment.

These efforts will not only build a new urban sensor network and enhance existing NevCAN network, they will more importantly build human expertise to help understand the complex interactions of human and climate induced changes on water resources, energy availability and environmental consequences. This effort will highlight student training to ensure that knowledge gained is built upon by future generations of scientists within the desert Southwest.

Integrative Aspects

The measurement, storage, and analysis of these data will leverage and expand upon the NevCAN resources of the SENSOR system to create a high-quality, long-term repository for hydrological and environmental analysis. The raw data and final analyses will be available to and of interest to educators, students, public utilities, and policy makers. Further, the long-term collection of this data will benefit environmental researchers seeking to determine the extended impact of population growth and renewable resources on the local climate and resulting changes to the hydrological cycle within this arid region.

3.3.3 ENERGY THRUST [Trzynadlowski, Etezadi-Amoli, Baghzouz]

The Energy thrust seeks a comprehensive understanding of the role of renewable energy sources within Nevada's power infrastructure. With its substantial solar, wind, and geothermal power generation potentials, Nevada is just beginning to realize and explore its options for renewable energy expansion. Traditionally, a small number of easily monitored large power plants have supplied power to the grid. Now, thousands of small-scale renewable-energy units, especially the photovoltaic (PV) ones, are added. Their sheer number and their power electronic interfaces greatly complicate the analysis of local energy systems [47]. This trend is expected to continue as prices for PV panels decrease and individual homeowners, businesses, and government agencies install these arrays on their properties.

Major Science Questions and Proposed Work

Acquisition of high-resolution data from various power plants, including the wind, PV, and geothermal facilities, will provide invaluable answers to questions regarding the existing Nevada energy profile and optimal development of additional renewable energy resources throughout the state. Analysis of a host of energy related data will allow better understanding of the dynamic of the grid, production and usage of energy, and identification of potential energy conservation measures. Optimal allocation of energy resources and improved efficiency and reliability of the energy infrastructure will dramatically enhance Nevada's competiveness in many areas of economy.

Collection of data to perform an appropriate energy analysis requires installation of advanced measuring equipment at numerous locations. Quantitative assessment of energy generation facilities – especially the PV arrays utilizing the ample sunlight resources of Nevada – requires time-sensitive collection of temperature, irradiation, and electric output data. This data can be captured using advanced phasor measurement units (PMU) in concert with solar panel diagnostic information and other sensors. The energy consumption information can be obtained using existing or newly-installed smart meters at residences and businesses.

Objectives

- 1. Determine the energy usage profile by collection and analysis of power generation and consumption information. It will allow an accurate short- and long-term prediction of energy usage to be provided to public utilities [48]. Hourly correlated data values will form the basis of this invaluable information resource.
- 2. Determine how temporal and spatial coordinates and atmospheric conditions affect the energy usage and production from renewable sources.
- 3. Perform detailed characterization of solar energy in Nevada. Collection of high-resolution temporal data over a wide area will allow the analysis of the impact of variable-output PV systems on the grid. Such data are critical for prediction, optimization, and integration of PV sources with the grid [49].
- 4. Evaluate energy conservation opportunities and optimal allocation of resources. Combining the energy usage profiles and solar energy characterization results, the applicability of various energy conservation and resource-allocation opportunities can be evaluated [50]. These include energy storage systems and smart-energy coordination strategies.

General Methodology

To accomplish the objectives aimed for, an extensive infrastructure for collection of a variety of energy related data must first be putting in place. An optimal distribution of sensors and meters at crucial locations, such as outputs of representative producers and users of electrical energy is particularly important. Temperature and solar irradiation sensors will be placed at the PV plants and in urban centers, as these factors significantly affect the energy usage for heating and cooling.

Electrical quantities will be measured using the existing smart meters of energy, current and voltage sensors, PMUs, and power-quality analyzers (PQA). A PMU measures the electrical waves on an electricity grid, using a common time source for synchronization, usually the GPS. It allows synchronized real-time measurements of multiple remote measurement points on the grid. The PMUs are

considered one of the most important measuring devices in the future of smart grid. A PQA trends voltage, current, imbalance, power, energy, events, flicker, THD, TDD, individual harmonics, and frequency, provides real-time graphical display of data, an on-site integral analysis and data retrieval without a computer or PDA, as well as remote communications and alarming.

Measured data will automatically and continuously be collected by the SENSOR system. Then, they will be periodically analyzed using operational real-time data and events management infrastructure, such as OSIsoft's PI system. Important results and conclusions will be shared with the local utility company (Nevada Energy [51]), with which close collaboration is expected. Working contacts will also be maintained with a number of individual energy producers such as selected geothermal and PV plants.

Integrative Aspects

Acquisition, collection, and storage of the energy-related data will leverage and extend the resources of the SENSOR system to create a high-quality, long-term repository for energy analysis. Both the raw data and final analyses will be of interest to educators, students, public utilities, and policy makers. The long-term collection of this data will benefit environmental researchers seeking to determine the extended impact of renewable resources on the local climate and environmental entities.

3.3.4 EDUCATION AND OUTREACH THRUST [Usinger, D. Mensing]

Objectives

The Education and Outreach component seeks to ensure that the extensive data available in the Nevada Data Center for the Environment, Water, and Energy (Center) is effectively utilized by specific interest groups, the general public, and policy-makers. The work will include both educational and outreach programs, including specific curriculum for middle school, high school and undergraduates; and targeted outreach to engage specific constituencies.

Proposed Work

Formal, non-formal, and informal educational approaches are proposed. The core educational component (core) will consist of two parts. First, a variety of anticipated scenarios relevant to different groups will be created to illustrate the power of the data. Examples include, but are not limited to changes in environmental and water conditions that could affect wildlife habitat, water conditions for crop production, energy requirements and usage, and the impact of new energy sources on the energy grid. Second, efforts to encourage use of the data by the public will be developed using user-centered design processes targeted to specific constituencies.

Formal Education. Well-articulated curricula will be developed by teams of educators for the middle school, high school, and undergraduate level. Instruction will focus on the following: (1) review and analysis of the scenarios (core); (2) the process of rigorously collecting accurate and reliable environmental data; (3) retrieving data from the Center's databases (core); (4) the development and implementation of formal projects, utilizing data available from the Center; (5) reporting findings from the project; (7) tackling the intricacies of reporting environmental changes related to climate and energy. The difference between the curriculum developed for the K-12 and undergraduate students will be the level of sophistication and complexity.

Non-Formal Education. Experience shows that simply providing raw data rarely results in extensive public use. We propose to work closely with two specific groups who are likely to experience the effects of climate change in the foreseeable future: Nevada farmers/ranchers and the Nevada Fire Safe Councils. By working closely with these two groups we will be able to determine their needs and prototype solutions available from the Center. Usability tests of our designs will allow for the production of data visualizations, interactive modules, and social media programs to engage users and maximize the usefulness of the Center. By learning about the needs of the users and matching them with scientists and data available through the EPSCoR project, our work will insure that the data is utilized by Nevadans who most need the information available through the Center.

Informal Education. In addition to the curriculum, data visualizations, interactive modules and social media programs available on the Portal, we propose to work with journalism students to document the work of the scientists in collecting data and members of the public using the data. These stories, which would include educational goals as well as human interest, would be submitted to local media and be available through the Center.

Integrative Aspects

Each focus of the project, (i.e., environment, water, energy), has an historic education constituency. For example, farmers and ranchers have historically been concerned about water. In addition, new education constituencies are envisioned. For instance, as energy sources become more distributed, consumers and policy-makers will need to understand how to interpret environment and energy data. Entities that use Nevada's public lands desire immediate and up-to-date information. The premise of the education and outreach component is that all data sources available through the Center will be appropriately integrated to provide a comprehensive understanding of the inter-relationship between the environment, water, and energy.

3.3.5 THE TEAM: STRENGTHS AND ORGANIZATION

For this project we have put together a diverse team of researchers, educators, and technical staff that combines a wealth of experience in areas pertinent to the proposed work with the determination and enthusiasm required to undertake the project's planned efforts. Notably, 12 of the team members have been involved –many in leadership roles– in the previous NSF EPSCoR RII cycle that made possible the creation of the SENSOR CI system (with its front-end representative subsystem, the NCCP) while the other 12 participants have joined the team to substantially expand the scope of Nevada's CI resources and the multidisciplinary research, education, and outreach activities these resources will enable.

The team, as indicated previously, is organized in four main project components, Cyberinfrastructure, Water and Environment, Energy, and Education and Outreach. The *Cyberinfrastructure* component consists of two subgroups, one (based in the CSE Department at UNR and the ECE Department at UNLV) dedicated to research, design, and implementation pertaining to the creation of the proposed new Nevada Data Center for the Environment, Water, and Energy, the other (based in the Nevada Seismological Laboratory at UNR) focused on the research and development needed for the project's networking and communication subsystems.

The PI of the project is Sergiu Dascalu, the lead of the CI component in the current NSF EPSCoR RII project. He will use the experience gained in this project to take the NCCP and the SENSOR system into a new phase, with a larger scope and additional far-reaching targets. The proposed project's CI group also includes Frederick C. Harris, Jr., who has served as Nevada CI lead in the NSF EPSCoR funded "Cyberinfrastructure Developments for the Western Consortium of Idaho, Nevada and New Mexico." Their combined project management experience and expertise in software engineering, human-computer interaction (Dascalu), parallel processing, and computer graphics (Harris) is excellently complemented by other CI members' remarkable research experience in areas pertinent to this proposal: evolutionary computation, genetic algorithms (Sushil Louis), algorithm design and analysis, data fusion (Yaakov Varol), computer networks, image processing (Shahram Latifi), geophysics, advanced visualization techniques (Graham Kent), real-time data management systems (Ken Smith), AI in simulators, intelligent agents (Bobby D. Bryant), network security, and communication protocols (Mehmet Gunes). The CI group also includes Michael McMahon, database administrator and programmer, and Eric Fritzinger, software developer, the two professionals currently in charge of building the NCCP and its related software tools. In addition, an Assistant Professor specialized in Intelligent Data Mining and Analysis will be hired to join the CI group.

The project component focused on *Water and Environment* consists of well-accomplished, world-wide recognized researchers from DRI, UNR, and UNLV. This component includes five senior scientists

(Nick Lancaster, Jay Arnone, Scott Mensing, Franco Biondi, and Lynn Fernstermaker), two junior researchers (Haroon Stephen and Guoping Tang), and an environmental research coordinator (Scotty Strachan) who has been instrumental in developing the current Sheep and Snake research sites. The group's expertise is extensive. It ranges from evaluating the impact of climate change on desert regions (Lancaster) and understanding the effects of global environmental change on the functioning of terrestrial ecosystems (Arnone) to the use of remotely sensed data for mapping, monitoring, and assessing the effect of environmental stressors on vegetation (Fenstermaker), palynology and vegetation dynamics (Mensing), ecoclimatology and watershed processes (Biondi), remote sensing and mathematical modeling in hydrology (Stephen), and parallel computing for ecological and hydrological modeling (Tang).

The *Energy* component consists of three senior researchers, two from UNR, one from UNLV, all with an outstanding track of scholar accomplishments. The group members excel in research on power systems, signal processing (Mehdi Etezadi-Amoli), power electronics and electric machinery (Andy Trzynadlowski), power quality (Yahia Baghzouz) and renewable energy (all three). Previous projects in which they have been involved have led to remarkable results, published in many journal and conference papers.

The *Education and Outreach* component benefits from the vast experience and remarkable accomplishments of two distinguished UNR professors, Janet Usinger and Donica Mensing. The specific expertise brought by them to the proposed project encompasses career development, bringing social constructionism into the teaching and research process, promoting diversity in public education leadership (Usinger), interactive journalism, and journalism in education, training, and employment (Mensing).

3.3.6 PARTNERSHIPS

The research and developments discussed have the potential to leverage existing partnerships and strategic alliances with various agencies, as well as forge new ones. These partnerships and their associated collaborative efforts will incorporate entities at various organizational levels from regional (Nevada) to national and international.

At the regional level, new research and development connections between UNR, DRI, and UNLV groups are enabled by the proposed project, while partnerships established during the current Track I developments with the *Nevada Seismological Laboratory (NSL)* [38] and the *Western Regional Climate Center (WRCC)* [35] will continue to develop and strengthen. Extensions to the NSL communication infrastructure will expand and improve data gathering capabilities, while advisement from WRCC will occur in relation to specific climate hardware components.

New regional partnerships will also be established – a logical process considering the significant research scope and infrastructure of the proposed project. Collaboration with state the public utilities NVEnergy [51], Truckee Meadows Water Authority (TMWA) [52], and Southern Nevada Water Authority (SNWA) [53] will facilitate the collection and use of energy- and water-related research data. The public utilities will benefit from the research results and data, providing them additional conservation and optimization strategies. The establishment of a partnership with the Nevada State Climatologist Office [54] is another potential avenue for mutually-beneficial collaboration, offering them mechanisms for high-quality data collection and management for additional data sources and sustainability funds.

At the national level, the *Western Tri-State Consortium* – established as a part of the current NSF EPScoR-funded Track II efforts between Nevada, New Mexico, and Idaho – will continue to develop its data and metadata exchange efforts between the data repositories of each state. This effort will likely be expanded to include other national institutions such as *NCDC* [56], *NOAA* [55], and *DataONE* [57].

At the international level, the proposed research and development will facilitate pursuing collaboration efforts that have been initiated by project participants, for example on joint work on information integration and data translation research with the *University of Seville, Spain* or on ecological and climate dynamics with the *University of Tuscia* in *Viterbo, Italy*. Undoubtedly, research made possible by the proposed project will lead to many new opportunities for international scientific collaboration for members of all project components.

BIOGRAPHICAL SKETCHES: PROJECT PI AND CO-PIS

Name	Organization	Project Group	Position
Dascalu, Sergiu (PI)	UNR	Cyberinfrastructure	Associate Professor
Arnone, Jay	DRI	Water & Environment	Research Professor
Baghzouz, Yahia	UNLV	Energy	Professor
Biondi, Franco	UNR	Water & Environment	Professor
Bryant, Bobby	UNR	Cyberinfrastructure	Assistant Professor
Etezadi, Mehdi	UNR	Energy	Professor
Fenstermaker, Lynn	DRI	Water & Environment	Research Associate Professor
Fritzinger, Eric	UNR	Cyberinfrastructure	Admin. Faculty Software Developer
Gunes, Mehmet	UNR	Cyberinfrastructure/Communications	Assistant Professor
Harris, Frederick	UNR	Cyberinfrastructure	Professor
Kent, Graham	SEISMO/UNR	Cyberinfrastructure/Communications	Professor
Lancaster, Nick	DRI	Water & Environment	Research Professor
Latifi, Shahram	UNLV	Cyberinfrastructure	Professor
Louis, Sushil	UNR	Cyberinfrastructure	Professor
McMahon, Michael	UNR	Cyberinfrastructure	Admin. Faculty Database Developer
Mensing, Donica	UNR	Water & Environment	Associate Professor
Mensing, Scott	UNR	Water & Environment	Professor
Smith, Kenneth	SEISMO/UNR	Cyberinfrastructure/Communications	Research Associate Professor
Stephen, Haroon	UNLV	Water & Environment	Assistant Professor
Strachan, Scotty	UNR	Water & Environment	Environmental Research Coordinator
Tang, Guoping	DRI	Water & Environment	Research Assistant Professor
Trzynadlowski, Andrzej	UNR	Energy	Professor
Usinger, Janet	UNR	Education & Outreach	Associate Professor
Varol, Yaakov	UNR	Cyberinfrastructure	Professor

Sergiu Dascalu

Associate Professor

Department of Computer Science and Engineering University of Nevada, Reno

Professional Preparation

Polytechnic University of Bucharest, Romania	Automatic Control,	MS, 1982
Dalhousie University, Halifax, Canada	Computer Science,	PhD, 2001

Appointments

University

07/02 - now	Associate Professor (07/1/2008 - present); Assistant Professor (07/02-06/08),
	Department of Computer Science and Engineering, University of Nevada, Reno.
	Director, Software Engineering Laboratory (SOELA), UNR (since 07/03/2008).
	Areas: Software Engineering, Human-Computer Interaction.
09/93 - 10/01	Research Assistant and Lecturer, Dalhousie University, Canada.
09/85 - 08/93	Assistant Professor (09/85-09/90) and Associate Professor I (09/90-08/93), Faculty of
	Control and Computers, Polytechnic U. of Bucharest, Romania.

Industry

01/91 - 07/93	Software Engineer, Alget Software Company, Bucharest, Romania.
09/82 - 09/84	Control Systems Engineer, Digital Equipment Maintenance Co., Romania.

Synergistic Activities

- UNR Donald Tibbitts Distinguished Teacher of the Year Award 2011, University of Nevada.
- Outstanding Undergraduate Research Mentor Award 2011, University of Nevada Reno.
- Mentor of UNR College of Engineering's Senior Scholar (Steve Komarov), Spring 2011.
- Runner-Up, Donald Tibbitts Distinguished Teacher Award 2010, University of Nevada.
- Faculty Advisor Award 2009, Nevada Center for Entrepreneurship and Technology (NCET).
- Lemelson Award for Innovation and Entrepreneurship 2005, College of Engineering, UNR.
- Three *Best Paper Awards* at conferences: CAINE-2008, Honolulu, HI, 2008; CATA-2006, Seattle, WA, 2006; and WITS-2001, New Orleans, LA, 2001.
- Program Chair/Co-Chair of 8 international conferences and member of Technical Program Committee of over 70 international conferences.
- Member of NSF review panels, 2007 and 2008.

Recent Collaborators & Other Affiliations

Dan Ames (Idaho State U.), Jay Arnone (DRI), Karl Benedict (University of New Mexico), Franco Biondi (UNR), Bobby D. Bryant (UNR), Wendy Calvin (UNR), Kendra Cooper (University of Texas at Dallas), Kent Crippen (UNLV), Gayle Dana (DRI), Philippe Dugerdil (University of Applied Sciences, Geneva), Lynn Fenstermaker (DRI), Jeff Gray (UA), Mehmet Gunes (UNR), Frederick C. Harris, Jr. (UNR), Nick Lancaster (DRI), Shahram Latifi (UNLV), Sushil Louis (UNR), Donica Mensing (UNR), Scott Mensing (UNR), Monica Nicolescu (UNR), Michael Nussbaum (UNLV), Tom Piechota (UNLV), Gale Sinatra (UNLV), Pavel Solin (UNR), Haroon Stephen (UNLV), Andy Trzynadlowski (UNR), Yaakov Varol (UNR).

Graduate and Post Doctoral Advisors

Peter Hitchcock (PhD advisor), Peter Bodorik, Bill Phillips, Trevor Smedley (Dalhousie University, Canada), Greg Butler (Concordia University, Montreal, Canada).

Thesis Advisor and Postgraduate-Scholar Sponsor

Graduate students advised in the past: 2 PhD and 31 MS in Computer Science who graduated 2003-2011: Sermsak Buntha, Muhanna Muhanna (PhD), C. Freinkel, M. Nilawar, G. Shum, M. Chandy, J. Jusayan, N. Hao, S. Okamoto, S. Buntha, E. Fritzinger, T. Calic, M. Parkar, R. Larmore, M. McMahon, M. Muhanna, Burcu Nemutlu, J. Quiroz, O. Akinwale, M. Haque, S. Talekar, S. Yendluri, N. Herndon, S. Chandrasekar, K. Huang, H. Kulkarni, J. Patel, E. Essa, C. Fleming, S. Reddy, C. King, Bilal Nemutlu, Victor Ivanov(MS).

Current advisor for 2 postdoctoral RAs (Adrienne Breland, Laurence Jayet – co-advised with Dr. Fred Harris), 5 PhD (S. Okamoto, I. Gibbs, S. Reed, Q. Yan, J. Patel) and 3 Master students.

John ("Jay") A. Arnone III

Research Professor

Division of Earth and Ecosystem Sciences Desert Research Institute

Professional Preparation

Ph.D	1988	Yale University	Plant Physiological Ecology
M.Phil.	1985	Yale University	Tree Physiology/Plant Physiological Ecology
M.F.S.	1981	Yale University	Tree Physiological Ecology, Forest Science
B.S.	1979	University of Vermont	Forestry/Forest Science
Appointn	ients		
2004-pres	sent	Research Professor; Deser	t Research Institute (DRI), Division of Earth and
		Ecosystem Sciences (DEE	S), Reno, Nevada
Jul 2000-2004 Associate Research Professor; (DEES)		sor; (DEES)	
1999-present Director, Frits Went Laboratory—EcoCELL facility; DRI		ratory—EcoCELL facility; DRI	
1998-Jun 2000 Assistant Research Professor; DRI			
1994-1998 Assistant Professor; University of Basel, Switzerland (non-tenure track)			ersity of Basel, Switzerland (non-tenure track)
1990-1993 Postdoc; University of Basel, Switzerland.			sel, Switzerland.
1998-1990 Postdoctoral Associate; Yale University			ale University
1984-1988 Doctoral Research Assistant; Yale University			nt; Yale University
1981-198	2	Research Assistant; Unive	rsity of Munich
1980-198	1	Research Assistant; Harva	rd University (Master's Thesis research)

Synergistic Activities

- Associate Director, Center for Energy Research, University of Nevada, Las Vegas (2004-present).
 Responsible for proposal writing, student supervision in various related projects, monthly progress
 reports, participations in design, construction and testing of numerous subsystems related to fuel cell
 integration in vehicles, hydrogen generation, photovoltaic performance and ant integration with utility
 systems.
- Co-Chair of the IEEE Executive Committee of the International Conference on Harmonics and Quality of Power (2003-present). Responsible for evaluation of proposals to host the conference, technical paper review, conference programs, invited speakers, selection of session chairs, technical directions, and best paper selection.

Synergistic Activities

- Director of the UNR CCRC Agent Modelling Laboratory; Technical Lead for agent modelling on the Cyber Conict Research Consortium's DECIDE project (2008 2010).
- Collaborator with Education Professor Jennifer Mahon on a classroom simulation based on Second Life (per publication list above). Dr. Bryant's students created a simple AI controller for the simulated students in the classroom.
- Co-Chair of the Special Session on Games for the 2011 Congress on Evolutionary Computation.
- Organizer of an EPSCoR-funded interdisciplinary *Workshop on Behavior Analysis for Artificial and Simulated Agents* at UNR (November 2007).
- Member of the IEEE Computational Intelligence Society's *Technical Committee on Games*; Chair of that committee's Task Force on Education (2011-); member of the committee's Task Force on Real-Time Strategy Games (Chair 2007-2008; Assistant Chair 2009-present).

Students Advised

Harmer, Mark	M.S. Thesis Advisor	N/A
Parker, Matthew	M.S. Thesis Advisor	N/A

Total graduate students advised (including in-progress):

- 1 PhD thesis
- 5 MS thesis
- 3 MS professional paper

Mehdi Etezadi-Amoli, Ph.D., P.E.

Professor

Department of Electrical and Biomedical Engineering University of Nevada, Reno

Professional Preparation

B.S. in Electrical Engineering, 1970, New Mexico State University, Las Cruces, NM. M.S. in Electrical Engineering, 1972, New Mexico State University Las Cruces, NM. Ph.D in Electrical Engineering, 1974, New Mexico State University Las Cruces, NM.

Appointments

University	
07/10 - Present	Chair, Department of Electrical and Biomedical Engineering (EBME), University of
	Nevada, Reno (UNR).
07/88 - Present	Professor, EBME Department, UNR. Main areas: Power systems planning, protection
	and transient analysis, applications of AI to power system problems, and renewable
	energy applications, analysis, protection, and interfacing.
07/83 - 06/88	Associate Professor of Electrical Engineering, University of Nevada, Reno.
07/77 - 05/79	Assistant Professor of Electrical Engineering, University of New Mexico,
	Albuquerque, NM
07/75 - 05/77	Assistant Professor of Electrical Engineering, University of New Mexico State
	University, Las Cruces, NM

Industry

06/79 - 06/83	Senior Protection Engineer, Arizona Public Service Company, Phoenix, Az.
Summers 85-98	Senior Engineer, NV Energy (formerly Sierra Pacific Power Company), Reno, NV.

Synergistic Activities

- Coordinator for the power grid cluster for the Renewable Energy Center at UNR.
- Member of National Council of Examiners for Engineers and surveyors. Prepare national exams for professional engineering registration within the country. Also, a Registered Professional Engineer in Nevada.
- Life Senior Member of IEEE, member of IEEE power Engineering Education Committee.
- Reviewer for IEEE Transaction papers on Power Systems and Power Delivery.
- Developed a number of graduate and undergraduate courses in power systems planning distribution, protection, and transient analysis.
- Member of UNR Faculty Network for Undergraduate Research

Sponsored Research

Presently funded by NV Energy and NV Renewable Energy Center

Recent Collaborators & Other Affiliations

• Nevada State Office of Energy, Albert Keri at ABB, Travis Johnson at NV Energy, Yahia Baghzouz at UNLV, Cansin Evrensoglo at virginia Tech, John Kleppe and Sami Fadali at UNR

Present Graduate Student Advisor

- Surabhi Chaudhri, MS, University of Nevada, Reno
- Russel Louie, MS, University of Nevada, Reno
- Mike Jensen, MS, University of Nevada, Reno
- Erik Chalko MS, University of Nevada, Reno
- Erik Madsen MS, University of Nevada, Reno
- Mahmoud Ghofrani, Ph.D., University of Nevada, Reno
- Amir Saman Arabali, Ph.D., University of Nevada, Reno
- Kent Choma, Ph.D., University of Nevada, Reno

Lynn F. Fenstermaker

Graduate Advisors

Stephen T. Hedetniemi (Clemson), Robert M Geist (Clemson)

Students Advised

Judith R. Fredrickson (2006), Beifang Yi (2006), Sara Nasser (2008), Bei Yuan (2009), Rakhi Motwani (2010), Laurence Jayet Bray (2010), Adrienne E. Breland (2011), Mukesh C. Motwani (2011), and 48 MS Thesis students.

Graham M. Kent

Director, Nevada Seismological Laboratory
Professor, Department of Geological Sciences and Engineering
University of Nevada, Reno

Professional Preparation

Degree	Year Conferred	Institution and Location
B.S.	1985	San Diego State University, CA
Ph.D.	1992	Scripps Instit. of Ocean., San Diego CA

Research and/or Professional Experience

2009-present	Director, Nevada Seismological Laboratory, UNR
2009-present	Professor, DGSE, Mackay, UNR
2002-2009	Director, Visualization Center at Scripps, IGPP/UCSD
2002-2009	Research Geophysicist, IGPP/UCSD
2000-2002	Associate Research Geophysicist, IGPP/UCSD
1998-present	Assistant Research Geophysicist, IGPP/UCSD
1996-present	Assistant Project Scientist/IGPP Scholar, UCSD
1994-1996	Assistant Scientist, Geology & Geophysics, WHOI
1992-1996	Postdoctoral Scholar, Geology & Geophysics, WHOI
1987-1992	Assist. Researcher, Scripps Institution of Oceanography
1985	Geophysicist (summer-hire), UNOCAL, Ventura, CA
1984	Geophysicist (summer-hire), Getty, Bakersfield, CA

Synergistic Activities

Director, Nevada Seismological Laboratory; Nevada State Seismologist; Chair, Marcus Langseth Steering and Oversight Committee (UNLOS); Member, Nevada Earthquake Safety Council.

Recent Collaborators & Other Activities

Gary Axen, Jeff Babcock, Rob Baskin, Glenn Biasi, Danny Brothers, Neal Driscoll, John Fletcher, Antonio Gonzalez, Bill Hammond, Alistair Harding, Steve Holbrook, Dan Lizarralde, John Louie, John A. Orcutt, Satish Singh, Larry Smarr, Paul Umhoefer, Robert Karlin, Gordon Seitz and Ken Smith.

Graduate Advisors

Doctoral Advisors

John Orcutt, University of California, San Diego; Alistair Harding, University of California, San Diego

Postdoctoral Advisor

Robert S. Detrick, Woods Hole Oceanographic Institution

PhD Students Advised

Stephen A. Hussenoeder (WHOI), Eric Hallenborg (Scripps/UCSD), Fiona Sutherland (Scripps/UCSD), Allison Jacobs-Dingler, Jeffrey Dingler (Scripps/UCSD), Danny Brothers (Scripps/UCSD), Annie Kell (UNR-PhD, current), Amy Eisses (UNR-MS, current), Gretchen Schmauder (UNR-PhD, current).

Nicholas Lancaster

Research Professor

Desert Research Institute

Professional Preparation

B.A	1971	Geography, University of Cambridge.
M.A.	1975	Geography, University of Cambridge.
Ph.D.	1977	Geography, University of Cambridge.

A ---- ------

Appointments	
2005-2008	Senior Director, Center for Arid Lands Environmental Management, Desert Research
	Institute.
2003-2005	Program Coordinator, Earth Surface Dynamics Program, US Geological Survey (on
	assignment from DRI)
2002-2007	Distinguished Research Associate, School of Geography, University of Oxford.
1999-2005	Adjunct Professor, Department of Geography, University of Guelph, Guelph, Ontario,
	Canada.
1994-present	Research Professor, Quaternary Sciences Center (now Division of Earth and Ecosystem
	Sciences) Desert Research Institute, Reno, Nevada.
1991-1994	Associate Research Professor, Quaternary Sciences Center, Desert Research Institute,
	University of Nevada System, Reno, Nevada.
1986-1990	Visiting Assistant Professor and Faculty Research Associate, Department of Geology,
	Arizona State University.
1983-1985	Lecturer and Senior Research Officer, Department of Environmental and Geographical
	Science, University of Cape Town.
1980-1982	Research Officer, Desert Ecological Research Unit, Gobabeb, Namibia.
1978-1979	Assistant Lecturer, Department of Geography, University of the Witwatersrand,
	Johannesburg.
1973-1978	Lecturer in Soil Science/Hydrology, Chancellor College, University of Malawi.

Synergistic Activities

- Bi-lingual Interactive Journalism. A New Voices grant awarded by the J-Lab: Institute for Interactive Journalism, \$17,000, May 2007-May 2009.
- Significant involvement in two Web sites that won a J-Lab Knight Batten award for innovation in journalism education, one on the Tahoe environment and one on Nevada politics (2007).
- Significant involvement in the OurTahoe Web site that won a first place award from the Online News Association (2007).
- Graduate director of innovative graduate program designed to foster citizen engagement in environmental decision making at Lake Tahoe.
- F. Donald Tibbetts Distinguished Teacher Award, runner-up, 2006 (university top teaching award)
- Silver Compass Award, 2005 (university award)
- Nevada Semenza Christian Award for Teaching Excellence, Reynolds School of Journalism, May 2001 and May 2006.

Innovations in teaching and training

Developed hands on classroom and field-based instructional materials to develop science based research skills among undergraduates and implemented these materials in numerous courses including Geographic Field Methods, Biogeography, and Inroductory Physical Geography. For this work I was honored for my teaching on three occasions, first in 2005 in the College of Science at UNR with the LeMay Award for Excellence in Teaching, next in 2006 with the highest teaching award in our university, the F. Donald Tibbitts Memorial Distinguished Teaching Award, and most recently in our state in 2007 with the Nevada System of Higher Education Regents Teaching Award. In 2010 I received the CASE Nevada Professor of the Year - Carnegie Foundation for Advancement of Teaching award. I have taught with the University Studies Abroad Consortium in Viterbo, Italy on two occasions, Summer 2007 (Environmental History of the Mediterranean) and Fall 2009 (Geography of Europe, and Field Methods).

Broadening the participation of underrepresented groups

I serve as a high school recruiter for our Department, College and University and have given numerous classroom presentations to students in High School across the state, as well as making presentations to high school counselors and community members. Presentations target underrepresented groups.

Service to the Scientific Community

Member, 1988 – present, Association of American Geographers – Secretary-Treasurer of the Biogeography Specialty Group between 1996 and 2000.

Reviewer of grant proposals submitted to the *National Science Foundation, United States Geological Survey, National Geographic Society, National Oceanic and Atmospheric Association.*

Reviewer of manuscripts submitted to refereed journals: *Madroño, The Holocene, Wetlands, Landscape Ecology, Western North American Naturalist, The Geographical Review, The Annals of the Association of American Geographers, Nature, Quaternary Research.*

Senior Panelist – National Science Foundation, Geography and Spatial Science program (2011 – 2013)

- Pioneered the concept of random pulse width modulation (RPWM) for power electronic converters, and developed several RPWM techniques. The RPWM has been widely adopted by industry, e.g., General Motors, Texas Instruments, and Cypress MicroSystems.
- Developed a new methodology of computer-aided design of energy-efficient electric drives (elected Fellow of the IEEE for (1) and (2)).
- Developed a new generator for low-power wind-turbine systems (two US patents granted).
- Authored five books and three book chapters on power electronics and electric drives for the use of students and practicing engineers.
- Associate Editor of IEEE Transactions on Industrial Electronics and IEEE Transactions on Power Electronics.

- Since 2001, in collaboration with the Nevada Department of Education, I have served as the codirector of two Nevada State GEAR UP projects (2001-2006 and 2007-2012) and have provided leadership in its evaluation and related research. The purpose of the project is to provide academic and financial support to first generation college-going students in a state with one of the lowest college-going rates in the country. This project involves coordinating with the seven academic institutions of the Nevada System of Higher Education, 13 Title I middle schools and 45 high schools in 8 of Nevada's 17 school districts. One of the objectives of the GEAR UP project is to increase the number of students pursuing STEM related fields in their secondary and postsecondary educational experiences.
- Provided leadership to the final year of the US Department of Education funded School to Career project which involved collaborating with all 17 Nevada school districts, the seven Nevada institutions of higher education, numerous businesses and community organizations.
- Served on the American Distance Education Consortium (ADEC) Program Panel to facilitate distance education opportunities to rural and underserved communities.
- Have developed numerous community-based nutrition education programs offered both in school and out of school.
- Several courses and research projects within the higher education focus of Educational Leadership
 program have explored diversifying the student body and the academic faculty at the University of
 Nevada, Reno as well as universities in general. My particular role in the research has been to bring
 social constructionism into the teaching and research process.
- I have served as doctoral committee member for students in computer science and masters committee member of students in nutrition and nursing.

Graduate Advisor

James W. Tomasson, Ph.D. (Ph.D. Advisor), Jerold App, Ph.D., Norman Pearson, Ph.D.

Thesis Advising

I was the doctoral advisor for Melanie Minarik at University of Nevada, Reno from 2003-2008; for John Kyle Dalpe at University of Nevada, Reno from 2003-2008; for Marvin Castagna at University of Nevada, Reno from 2005-2010; for Diane Nicolet at University of Nevada, Reno from 2005-2010. I am currently chairing the following students who are on schedule to defend their dissertations prior to May, 2012: Lauren LaCombe, Natalia Callahan, and Stephanie Woolf, all at University of Nevada, Reno.

Yaakov L. Varol

Professor and Chair Department of Computer Science and Engineering University of Nevada, Reno

Professional Preparation

Ph.D., Mathematics, 1971, University of Wyoming, Laramie, Wyoming. Bachelor of Engineering, Electrical Engineering, 1967, Robert College, Istanbul, Turkey.

Appointments

Professor and Department Chair, Computer Science and Engineering, University of
Nevada, Reno.
Department of Computer Science, Southern Illinois University, Carbondale, Illinois,
Associate Professor (1978-1982), Professor (1982-1996), Chair (1986-1992).
Senior Lecturer, Department of Applied Mathematics and Computer Science, University
of the Witwatersrand, Johannesburg, South Africa.
Assistant Professor, Department of Mathematics and Computer Science, Ben Gurion
University of the Negev, Beer Sheva, Israel.

Over the 40 years of professional activity in academia, I have taught diverse subject matter in computer science and engineering, conducted research and supervised projects and dissertations on a variety of topics. Some were applied and development oriented like traffic simulation and road design, others were more fundamental and theoretical. Work on data fusion, image processing, and security have provided me with tools and techniques and understanding that would be directly applicable to this proposal. My interest and long-term involvement in curricular issues and graduate education, as well as, my participation in the Hewlett Foundation project on Engineering Education, will also be relevant and significant assets to this proposal, as we attempt to integrate interdisciplinary research and development into new courses and graduate mentoring. This proposal will benefit from the administrative, management and human resources skills I developed as department chair over 20 years of serving in that capacity. It is likely that part of my contribution to the project will be as a generalist and as a coordinator and integrator.

UNR BUDGET JUSTIFICATION

CYBER INFRASTRUCTURE COMPONENT

Salaries:

- **Sergiu Dascalu** requests 2.0 months salary support per year for five years as the PI. He will be responsible for project management and integration and research.
- Support is requested for Frederick C Harris, Jr for 1 month per year for 5 years.
- Research Team members request support for (1 month each for years 1 and 2 and 0.5 months support for years 3, 4, and 5) Sushil Louis, Yaakov Varol, Memet Gunes, and Bobby Bryant
- Assistant Professor in Intelligent Data Mining This position will be hired in year 3. Support is requested for 3 years (years 3,4, and 5) for 9 months per year of academic salary and 1 month per summer each year.
- Database Manager and Systems Administrator [Michael McMahon] support is requested for 12 months per year for 5 years Year 1 Base \$82,000
- Database Designer and Software Developer [Eric Fritzinger] support is requested for 12 months per year for 5 years. Year 1 Base \$77,000
- Support is requested for Graduate Research assistants 12 months per year for 5 years (50% academic and 100% summer support) 4 RAs per year. \$1700 per month (for academic months)
- Note: 2% inflation and merit each year.
- Depending on the success of other NSF proposals, if awarded, this project may result in Drs. Dascalu's, Harris's, and Bryant's total commitment for all NSF supported projects exceeding the two-month limitation for Senior Personnel. The proposed level of commitment for the proposal is appropriate to the scope of work and is required in order to fulfill the objectives of this project within the proposed timeframe.

Equipment: We request support for Data Storage, Compute nodes, and Interconnect equipment. Year 1 and 2 \$300,000 each.

Travel: Trips to conferences to present research work. One trip per team member is requested at 1200 each trip (covering transportation, lodging, and per-diem).

Tuition: Tuition for RA positions \$260 per credit plus \$100 per credit differential tuition [CoE]. 9 credits per semester.

Startup Package: A startup package for the Assistant Professor in Intelligent Data Mining is requested. \$70,000 in year 3, and \$60,000 in year 4 and \$50,000 in year 5.

Materials and Supplies: We are requesting \$800 per team member per year to cover conference registration fees as well lab supplies and repairs for computers (hard drives, monitors,...). Year 1 we are also requesting \$2000 per team member for new computers.

Other Direct Costs:

- \$10,000 per year for software licenses.
- Nevada Seismological Laboratory Networking approximately \$140,500 per year to cover salary for 2 faculty, technician salary, networking equipment, and travel [This makes about \$200,000 per year for the NSL CI/Communications subgroup].

EDUCATION AND OUTREACH COMPONENT

Salaries:

- **Janet Usinger** requests 1.5 months salary support per year for five years.
- **Donica Mensing** requests 1.5 months salary support per year for five years
- Support is requested for 2 Graduate Research assistants 12 months per year for 5 years \$18,000 per year each

Equipment:

Travel: Trips to conferences to present research work. \$12,000 per year

Tuition: Tuition for RA positions \$260 per credit, 9 credits per semester.

Materials and Supplies: We are requesting \$10,226 per year

Publication Costs: We are requesting \$4,000 per year.

WATER AND ENVIRONMENT COMPONENT

Salaries:

- Franco Biondi and Scott Mensing will lead the compilation of instrumental and proxy data, supervise both the postdoctoral researcher and the PhD student, maintain close ties with the NSF-EPSCoR transect network research groups, and interface with other senior scientists. They request 1 month year 1 and 1.5 months salary support per year for years 2,3,4, and 5.
- Scotty Strachan will be the Transect Manager and will (a) supervise operations, maintenance, data communications, and personnel assisting him, and (b) test, deploy, and maintain electronic sensors as well as field and laboratory equipment, and (c) help the senior investigators, post-doctoral fellow and graduate students in their activities.
- **Postdoctoral Research Associate (TBD)** will be selected among a pool of applicants gathered after publicly announcing the availability of the posts. We ask for 12 months of funding per year to support the postdoctoral researcher.
- **PhD Student (TBD)** will be selected among a pool of applicants gathered after publicly announcing the availability of the posts.
- Undergraduate Student (TBD)

Equipment:

• Major equipment for \$120,000 to purchase the "Lignostation" densitometer for state-of-the-art precision measurement of wood density. It should be emphasized that wood density measurements performed with the "Lignostation" system are critical to distinguish variation in early season and late season growth, a key distinction if we are to better understand the controls of tree growth and influence of snow cover in Nevada mountain ecosystems. Additional equipment is requested for the instrumented transects to maintain and expand the instrumental network

Travel:

• Rates for airfare, per diem, and auto rental have been based upon experience with similar type projects as well as the Federal Travel Regulations. Travel support is requested for field work and for project personnel to attend one-two national and international meetings per year.

Materials and Supplies:

• We are requesting \$11,850 (yr 1), \$14,600 (yr 2), 25,600 (yr 3), \$14,700 (yrs 4 and 5)

Publication Costs:

• We are requesting \$3,000 per year. (except year 2)

ENERGY COMPONENT

Salaries:

- Mehdi Etezadi-Amoli and Andy Trzynadlowski are requesting 0.5 academic months and 1 summer month each per year for 5 years.
- Because of the state budget shortages, no salary raises in the consecutive years have been assumed
- Funding for 2 RAs per year is requested at \$20,000 per RA
- Funding for 2 Undergraduate students is requested at \$10 per hour 290 hr/yr.
- Starting in Year 2, an experienced engineer will be hired on the letter-of-appointment (LOA) basis to run the day-to-day activities of the Energy group. Estimated salary: \$75,000/yr.
- Depending on the success of other NSF proposals, if awarded, this project may result in Drs. Etezadi-Amoli's and Trzynadlowski's total commitment for all NSF supported projects exceeding the two-month limitation for Senior Personnel. The proposed level of commitment for the proposal is appropriate to the scope of work and is required in order to fulfill the objectives of this project within the proposed timeframe.

Equipment:

- We request support for Phasor Measurement Units and Associated Devices (\$100,000 in year 1)
- We request support for Megger's PA9-Plus Monitoring Systems (\$20,000 in year 1)

Travel:

• Yearly travels of two participant to scientific conferences are envisioned.

Tuition: Tuition for RA positions \$260 per credit plus \$100 per credit differential tuition [CoE]. 9 credits per semester.

Fringe Benefits:

- Faculty and Postdocs academic month fringe rate is 27%,
- Faculty summer salary fringe rate is 4%,
- LOA's fringe rate is 10%
- Graduate Assistants fringe rate is 15%, and
- Undergraduates fringe rate is 2%

Facilities and Administrative Costs:

UNR's indirect cost rate is 41% for on campus research. This rate is effective July 1, 2009 through June 30, 2012 as approved by the Department of Health and Human Services.

DRI BUDGET JUSTIFICATION

Salaries and Fringe Benefits

The Desert Research Institute (DRI) is a nonprofit research institution of higher education (as opposed to a degree granting entity). As such, DRI faculty salaries are funded solely from grants and contracts with no ability to obtain tenure. We have been informed by an NSF senior policy specialist that soft money institutions, such as DRI, are exempt from the new guidance (Chapter II – Section C.2g(i), Salaries and Wages in the October 2008 NSF Proposal and Award Policies and Procedures Guide) which limits salary support.

Nick Lancaster requests 2.0 months salary support per year for five years as the environment component PI. He will be responsible for DRI project management and integration. He will also participate in the research effort to assess changes in environmental parameters with time and to detect any significant trends that may occur.

Jay Arnone requests 2.0 months salary support per year for five years to provide graduate student training, supervision and analysis of transpiration measurements (using sap flow) and understory plant community ET (using static chamber), quantifying plant source water using 18O stable isotopes, assist with isotopic tracking of upslope water to basins, and assist with reporting and publication of peer review articles. . He also will work closely with Tang on the LPJ-GUESS and RHESSys modeling research.

Lynn Fenstermaker requests 2.0 or 2.5 months salary support per year for five years to coordinate the water component activities and oversee acquisition and analysis of satellite remote sensing data and images for all transect sites and regions that will be used in LPJ-GUESS and RHESSys modeling. She will also assist with monitoring of phenology, LAI, the National Vegetation Classification System plots, will work closely with Tang on the modeling effort and will participate in the preparation of reports and peer review journal publications.

Guoping Tang requests 3.0 months salary support per year for five years to parameterize LPJ-GUESS and RHESSys models for the Great Basin Desert and then perform modeling runs to evaluate the performance of these models and make predictions about hydrologic and environmental response based on measured climate variability and projected regional climate, renewable energy and other human change. He will work with the team to document results in peer review publications.

Richard Jasoni requests 2.0 or 2.5 months salary support per year for five years to supervise quantification of ET of phreatophytic (northern transect) and nonphreatophytic (southern transect) basin ecosystems (particularly eddy covariance), surface runoff and streamflow, canopy interception, and assist with understory ET measurements, measurement of woody plant sap flow and plant canopy phenology, LAI, and understory communities.

Support (12.0 months/year for five years) is requested for one **Postdoctoral Fellow** (to be hired) who has relevant experience in modeling renewable energy/population growth water needs and potential future feedbacks.

Support is request for **two M.S. Graduate Research Assistants** (12.0 months/year for five years; to be hired) and **one Ph.D Graduate Research Assistant** (12.0 months/year for five years; to be hired) and **one/half of a Ph.D. Graduate Research Assistant** each year in years 2 and 3.

Salary rates are listed at the Jan 1, 2012 rate. The outyears include a 5% cost of living and merit. DRI's fringe benefits are calculated annually based on the fringe benefits record from the prior year. The rates

are subject to Department of Health and Human Services (DHHS) audit. The rates effective July 1, 2010 are 44.9% for professional employees, 36.7% for PostDocs,

55.8% for Technologists, 20.1% for graduate students, and 2.8% for undergraduate students. Fringe benefits for professional and technical employees include retirement, health insurance, Medicare, Workman's Compensation Insurance, unemployment taxes, and accruals for sick and annual leave.

Equipment

We request support for sapflow, soil moisture and precipitation sensors to assess variability within vegetation zones for a total of \$43,472 in year 1 and \$30,000 in year 2.

Travel

Field visits: We request funds to allow 5 people to make 8 trips in year one and 5 trips in the subsequent 4 years to the NevCAN monitoring station sites and adjacent areas. We are therefore requesting \$47,200 in year 1 and \$28,960 per year in the remaining 4 years.

Materials and Supplies

We are requesting approximately \$4000 in years 1 and 2, and approximately \$4500 per year in years 3-5 to cover the cost of field and laboratory supplies. We also request \$3679 in year 5 for publication costs.

Facilities and Administrative Costs

DRI's indirect cost rate is 59% for federal agencies that do not allow independent research and development (NSF). This rate is effective July 1, 2010 through June 30, 2013 as approved by the Department of Health and Human Services. The indirect costs are based on salaries, benefits, expenses, and equipment used for Institute operations and maintenance of offices, laboratories and buildings; providing administrative support for grant and contract activities, human resources, accounting, budgeting and regulatory compliance as stated in OMB Circular A122.

UNLV BUDGET JUSTIFICATION

CYBER INFRASTRUCTURE COMPONENT

Salaries:

- Shahram Latifi Dr. Latifi is a Co-PI and the person responsible for the project at the UNLV campus. Even though, he will supervise the project all year round, support is requested only for one and a half months (1.5) of Summer each year. No cost of living adjustment is included for subsequent year.
- **Graduate Students** Support is requested for two PhD students who will participate in all phases of the project. These students who should have background in software design and communications & networking. They will help with automation of data management and collection and transferring of scientific data to the appropriate modules.
- Undergraduate Students Support is requested for an undergraduate student (Junior/Senior) to help with surveys, scientific searches, and collection of articles.

Equipment:

• No Equipment is requested. Existing equipment in the PI's lab (7 state of the art computers with visual studio software) will be used for this project.

Travel:

• We are requesting funds to cover 4 professional conferences per year- one international and the others national.

Tuition:

• Tuition is considered part of a graduate assistant's overall compensation package. We have calculated these costs based on 9 credits per semester for each of Fall and Spring and 3 credits in Summer + semester fees. Our current rates are Spring 12 (222); Summer 12 (244); Fall 12 – end of project estimates a 5% increase per year.

Materials and Supplies:

• We are requesting \$2000 per year to cover conference lab supplies and repairs for computers (hard drives, monitors).

WATER AND ENVIRONMENT COMPONENT

Salaries:

- **Haroon Stephen** will manage and develop the project and is requesting 1.5 summer months per year. This time will be spent in equipment acquisition, graduate student mentoring, undergraduate student supervising, and field data recording system development. He will develop partnerships with the potential user and city planning community. He will also spend time in integrating the program into the city planning. He will also develop one research papers for publication and present preliminary results at conferences.
- Two PhD and one MS degree student will be engaged in this project. First Phd, second PhD, and MS students will be engaged during years 1-3, 2-4, and 4-5, respectively. Graduate activities will include development of field data recording system and model development for scientific research of energy-water-environment nexus. This would include, setting up the field data equipment, development of deployment strategy, and development of data archival and management system. They will also develop models to perform scientific research on the field data.

• Undergraduate Student: Undergraduate students will be engaged in supporting the activities of faculty and graduate students. They will be trained to perform several tasks that require repeat executions such as equipment calibration and testing. They will also support testing of the equipment in the field and field data recorder deployment.

Equipment:

All the equipment will be purchased in the first two years. The equipment will include hardware
and software for developing sensors. Low cost sensors will be developed using sensors,
microprocessors, and data storage chips. The equipment to test and calibrate sensors will also be
purchased.

Travel:

• Travel money will be used by faculty and graduate students to present research at conferences.

Other Direct Costs

• This includes materials and supplies and cost of publications. Moreover, vehicle rental cost is added for field equipment testing and field data collection

ENERGY COMPONENT

Salaries:

- Y. Baghzouz is requesting 1.5 summer months each per year for 5 years.
- Funding for 2 RAs per year. During the first year, the salary of each student is \$1,500/month (for 12 months) and a yearly tuition fee of \$6,000/student.

Equipment:

• An amount of \$18,000 is allocated to purchase a power analyzer/recorder and its accessories including current and voltage probes. The instrument will be used thought the project to measure and record various powers and power quality events.

Travel:

• A budget of \$2,000-\$3,500 is needed to cover the cost of attending conferences (an average of two per year) and present technical papers.

Materials:

• \$2,000 per year is requested to cover office and lab supplies (Xerox paper, printer ink, posters, etc...) for the faculty member and the two graduate students

Fringe Benefits:

• UNLV charges the actual cost of benefits to sponsored projects; however, we use a benefit rate when estimating benefits for cost proposals. The appropriate current rates have been used as follows: Professional Staff @ 32% and Graduate Assistants @ 17%.

Facilities and Administrative Costs:

• UNLV F&A cost is calculated by predetermined rate as stipulated by DHHS Rate Agreement dated 05/01/08 (DHHS Audit Agency, San Francisco). The following rates are effective beginning 07/01/08: Research (on-campus)= 43.5% MTDC; Research/Instruction (off-campus) = 26% MTDC; Instruction (on-campus) = 56.5% MTDC; Other Sponsored Activities (on-campus) = 31.6% MTDC and Other Sponsored Activities (off-campus) 23.6%

OVERALL BUDGET ALLOCATION

The overall budget allocation for the project has been:

\$3,000,000/year distributed as: \$2,000,000/year UNR; \$600,000/year DRI and \$400,000/year UNLV

Total for the 5-year duration of the project is:

\$15,000,000 total project distributed as: \$10,000,000 UNR; \$3,000,000 DRI; and \$2,000,000 UNLV

The actual detailed budgets have resulted as:

\$14,907,377 total project with \$9,988,369 UNR; \$3,000,000 DRI; and \$1,918,908 UNLV

FACILITIES, EQUIPMENT & OTHER RESOURCES

Include descriptions of any proposed institutional commitments regarding either personnel or facilities and other physical infrastructure. Most importantly, if an institution is required to make significant modifications to a building, acquire a new building or land, or make arrangements to use other facilities for the focal area to be successful, these requirements must be explained. For any pre-proposal requiring significant institutional resources, authors are strongly encouraged to initiate a discussion with the appropriate institutional authorities prior to submission of the pre-proposal.

Laboratories

University of Nevada, Reno

- UNR Grid Computing Cluster
 - o Provides a central institutional infrastructure (i.e. physical space, power management, and network connectivity) for servers used for grid computing purposes (i.e. modeling and simulation).
- Software Engineering Laboratory (Sergiu Dascalu); 400 ft²
 - o Research and design of large software systems, software frameworks, software processes, and interactive systems.
- Evolutionary Computing Systems Lab (Sushil Louis); 500 ft²
 - O Development of computer processing methods that evolve without human intervention.
- High Performance Visualization Lab (Fred Harris); 400 ft²
 - o High parallel processing, advanced visualizations, virtual reality applications, distributing computing, simulation environments.
- Computer Networking Lab and Reconfigurable Network Lab (Mehmet Gunes); 600 ft²
 - o Both devoted to the research on communications and networking
- The Department of Geography hosts laboratories for dendrochronology (DendroLab), palynology (also used for packrat midden studies), spatial analysis (the G-lab), conservation biogeography, together with the State Climate Office and a computer laboratory for Geographic Information Science
- Mensing Pollen Lab (Scott Mensing)
- Engineering Computing Center of the College of Engineering is also available for usage
 - o Contains five labs, each of which has many Linux and Windows machines for use by students as simulation and design workstations as well as for classroom experimentation

University of Nevada, Las Vegas

- There is a 1300-sqft laboratory housed in TBE (Engineering building) equipped with computers, and Peripheral devices.
- GIS and Remote Sensing Visualization Facility (anticipated to be operational by February of 2012)
 - o Large projection system
 - o Ability to seat 12-15 people
 - Equipped with software and hardware for 3D visualization, video conferencing, and wide frame display presentation
- GIS and Remote Sensing Core Lab
 - o High-end processing capability to acquire, process, and visualize geographical information
 - Research-centered lab and continues to propose and conduct synergistic research activities for UNLV and the region

Desert Research Institute

- Soils and Water Laboratories
 - O Supports broad areas of research including modeling simultaneous transport of mass and energy through porous media; soil leaching; and soil and water chemistry\
 - Equipped to determine physical soil parameters including saturated and unsaturated hydraulic conductivity, water diffusivity, porosity, water content, bulk density, particle size analysis, and moisture retention characteristics
 - Advanced and rapid tensiometer-pressure transducer system is available to study moisture movement under isothermal and non-isothermal conditions

Nevada Seismological Laboratory (UNR)

- Provides network infrastructure and management expertise that supports the managed and structured collection, acquisition, and dissemination of research data. This network forms a part of the existing SENSOR system developed under Track I.
- Staff members include a professional software developer and network systems specialist, three seismological technicians, and one record analyst.
- Five graduate research assistants in degree programs of the Dept. of Geological Sciences and Engineering, and the Graduate Program of Hydrologic Sciences, are supported.
- Maintains an extensive capability in geophysical imaging and computational resources
- NSL operates the Western Great Basin Seismic Network (a component of the USGS Advanced National Seismic Network), which consists of approximately 110 real-time seismograph stations, and all data is telemetered to the NSL Data Center
- The principle source of earthquake information for Nevada and eastern California
- Maintains digital data since 1984, when digital waveform recording began
- Recent enhancement to the microwave system are being conducted under FCC spectrum relocation; these
 programs will implement a wideband wire-less IP digital communications backbone between Reno and Las
 Vegas and into parts of central Nevada

Computer Equipment

University of Nevada, Reno

- NSF EPSCoR Track I Nevada Climate Change equipment
 - 33x SunFire x4140 servers Used for the existing Track I NSF Nevada EPSCoR research, 2 of these servers are used as virtualization hosts for database, web, and other (8 total) infrastructure servers and services. The remaining 31 servers are available for modeling activities required by the project, and have been integrated into the UNR Grid Computing cluster for that purpose.
 - O 3x SunFire x4540 storage servers Used to support existing Track I NSF Nevada EPSCoR research, each server has a raw storage capacity of 24TB. One is configured in a RAID array for primary storage of research data and infrastructure support (e.g. storage of virtualized server images, database files, etc.); one is configured as a backup server (located on an opposing end of campus) for the primary storage server; one is a hot-spare that can quickly replace a failed server at any time.
- Department of Computer Science and Engineering
 - Computer Networking Lab
 - Contains a major server (Xeon 2.93GHz processor, 12GB RAM, RAID 5), 7 Linux machines, 4 Windows machines, 1 iMac, and 10 laptops for use in research and development
 - o Reconfigurable Network Lab
 - 9 Linux machines, 12 Cisco 1811W routers, 12 Linksys switches, 30 wireless sensor nodes, and 1 HOKUYO laser sensor for use in research and education

- The UNR Research Grid's cluster consists of 63 Sun Fire X4100 and X4200 servers as compute nodes, a Sun Fire X4600 computer as head-node, and a Sun Fire X4500 "thumper" as the cluster's disk array (24 TBytes total storage in network attached devices)
- All research labs are equipped with networked personal computers, Sun workstations, printers, and scanners. Dell and Mac laptops are also available for research and development in the Computer Science and Engineering labs.
 - Software Engineering Laboratory also has 4 touch-screen displays as well as 2 Sony cameras and lightning equipment for video-recording of demos and presentations.

Department of Geography

- o Computer Lab
 - 24 networked PCs
 - Runs ESRI software under a system-wide license, and has GPS receivers, a digital SLR camera, several dual-monitor geospatial computer workstations for GIS, digital image processing, and modeling

DendroLab

- Analytical equipment consists of digital image analysis systems, tree-ring measuring devices, microtomes, stereo-zoom binocular and compound microscopes, and extraction lines for stable isotope analysis. In addition, they have a Trimble GeoExplorer3 Geographic Positioning Systems and lower-end GPS units
- Two VELMEX systems interfaced with video cameras mounted on stereo-zoom binocular microscopes. Wood anatomical samples can be prepared using a sledge microtome with both reusable and disposable blades. A compound microscope interfaced with a digital camera is available for generating high-resolution images. Advanced statistical and graphical analyses are performed using programs running on DendroLab computers or the UNR Citrix server

Mensing Pollen Lab

- o Four Nikon Labophot light microscopes with high quality (Plan-Apo) 40x and 100x objectives for pollen analysis, and two Nikon dissecting scope for dendrochronology, charcoal and macrofossil analysis
- Department of Electrical and Biomedical Engineering
 - O High-performance Internet-connected personal computers with auxiliary equipment will be available for the Investigators at the EBME Department and the Engineering Computing Center. The installed software pertinent to the project includes PSIM for simulation of power electronic and other power conversion systems, Simulink and ACSL for dynamic simulations, Visual C++ and Code Warrior for software development, PSpice for circuit analysis, Matlab, MS Excel, and MS Word.

University of Nevada, Las Vegas

- There are six quad-core high performance DELL workstations in the lab equipped with standard
 educational software programs including Mathematica, Microsoft Visual Studio, MATLAB, and a suite of
 image processing/visualization programs. Application and code development packages for image and
 signal processing, multi- and hyper-spectral data analysis and visualization, network simulation and
 analysis tools are provided.
- 5 Servers, 15 workstations, 3 Toughbooks
- High-capacity network drive and several external hard drives
- GPS Receivers

Desert Research Institute

- Computational Facility
 - Used for modeling and simulations

Numerous computers are available for running software packages including the LPJ GUESS and RHESSys
ecosystem and ecohydrological models and the ENVI image processing software and ArcGIS needed for
this project.

Office Equipment

University of Nevada, Reno

- Department of Electrical and Biomedical Engineering
 - o Office space, equipped with personal computers, printers, Internet and local area network access, telephone, and furniture is available for the investigators at the EBME Department
- Department of Computer Science and Engineering
 - All faculty have office space, a desktop computer, a laptop computer, telephones, Internet and network access, and printer access
- Room 4066 of the William Raggio Building (College of Education) will be used to house one of the graduate students hired to support the Education and Outreach component of the project
 - Contains a relatively new (2010) desktop computer with a full suite of appropriate software for use by the graduate student and is fully equipped with appropriate office equipment, e.g. telephone, printer, calculators, etc.

University of Nevada, Las Vegas

- Faculty have offices, personal computers, and access to printers
- Mobile printer with carrying case

Desert Research Institute

• Office space and computers are provided for faculty, graduate students and post-doctoral scholars

Other

University of Nevada, Reno

- NSF EPSCoR Track I Nevada Climate Change equipment
 - 2x APC UPS systems Refurbished as a part of the existing Track I project, these UPS systems
 provide data security to all hardware involved in the data collection and management process.
 Hardware is shielded from power disruptions and fluctuations; in the event of an extended power
 failure, systems are automatically gracefully and safely shut down.
- Mensing Pollen Lab
 - Water deionizer for purification, and a fume hood and Beckman centrifuge for pollen extraction
 - Laboratory oven for drying samples, a muffle furnace for LOI analysis, and a desiccators for the storage of samples during analysis
 - o 6 by 8 walk-in cooler for the storage of sediment cores
- Department of Electrical and Biomedical Engineering
 - o Digital storage oscilloscope TDS 1002 from Tektronix
 - Digital real time oscilloscope TDS 340A from Tektronix
 - o Digitizing oscilloscope 54501A from Hewlett-Packard
 - Signal generator HP 8656B for Hewlett-Packard
 - o Spectrum Analyzer HP 35665A from Hewlett Packard
 - Microcontroller and DSP development kits from Motorola (MPC565) and Texas Instruments (TMC320F243)
 - o Power electronic inverters, VLT5032 (40 hp) and VLT5005 (5 hp), from Danfoss.

- o Three-phase induction motor, 230 V, 40 hp, 60 Hz, 6 poles.
- o DC generator, 240 V, 40 hp, 1750 r/min, with a 180 V, 5 A exciter and 1 hp cooling blower.
- A well-equipped Engineering Shop is available at the EBME Department. It can be used for development of electronic circuits and maintenance of experimental setups. The EBME Department Engineer will provide free technical advice regarding assembly of electronic circuits, and the EBME Department Secretary will provide free clerical help.
- The University of Nevada, Reno library system is a state-of-the-art facility that provides online full-text access to a large number of journals and books.

University of Nevada, Las Vegas

- The National Supercomputing Center for Energy and the Environment; A full-service supercomputing
 facility with national network accessibility. The center's advanced high performance computing systems
 are made available to educational and research centers, state and federal government agencies, and the
 private sector in Nevada
- Laminator
- Plotter (large format document printer)

Desert Research Institute

- Western Regional Climate Center
 - o Repository of weather and climate data for the western United States

Major Equipment

• 13 Transects as part of the NSF EPSCoR project "Nevada Infrastructure for Climate Change Science, Education and Outreach," split between the Sheep and Snake ranges of southern and eastern Nevada.
